

FILTRATION MEDIA AND FILTERS TESTING CHARACTERIZATION OF PERFORMANCES

Presentation

Principles and mechanisms of filtration (1hr)

- Filtration theory (Darcy's law)
- Operating parameters having an impact of the filtration performances

Characteristics of the fluids under filtration (2hrs)

- Characteristics of the liquid itself (superficial tension, viscosity, density)
- Size characteristics of the solid particles (particle size distribution in number, mass or volume)

Characteristics of filter media (4hrs)

- intrinsic: structure, particle size, mesh, pore ...
- functional: hydraulic (permeability, pressure drop, ...), filtering (efficiency, threshold, cut off ...), compatibility (resistance to mechanical, chemical stresses ...)
- integrity check

Panorama of the existing standards used in the fields of the process fluids, the fluid power, the fuels and the lubricating oils
